Hardware Placement Guide

To ensure that you get the most out of your Digital Food Safety solution, you must correctly setup your hardware within your business.

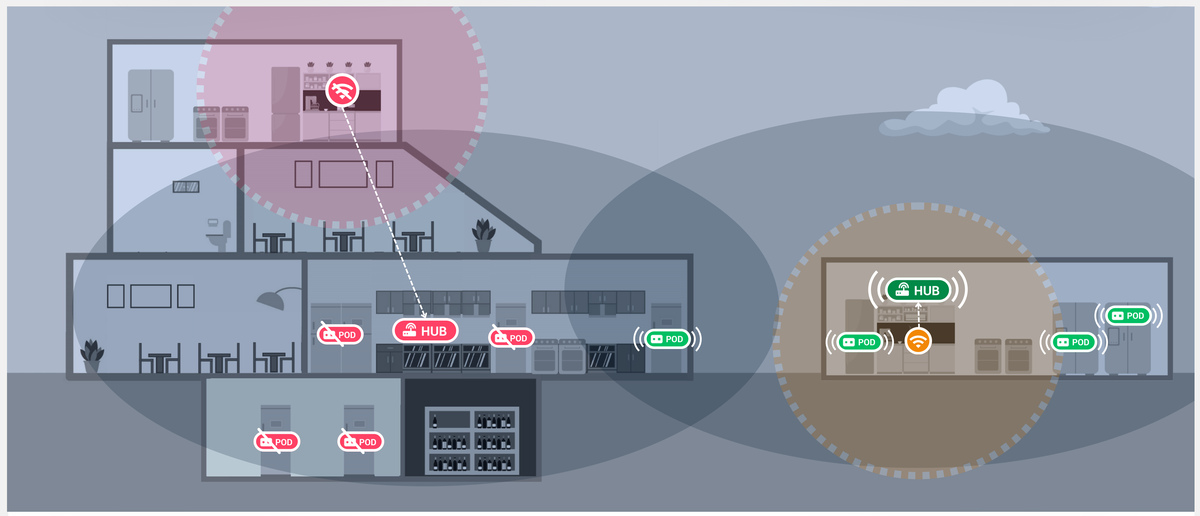

First, **place your Smart Pods within your fridge and freezer appliances**, in the centre of a middle shelf. Then, follow the below instructions to correctly install your Hub:

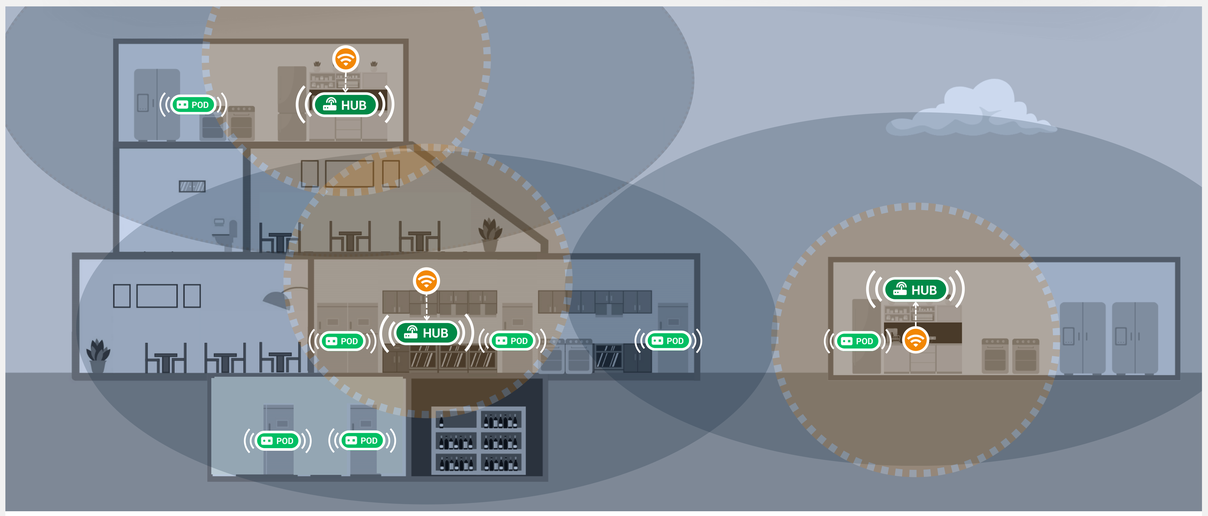

1) Your Hub needs to be within range of your Pods, in a central location. **This in an example of bad Hub placement**, as it is in the basement, not reaching all of the Pods in the main kitchen.

2) This is an example of good Hub placement, with the Hub sitting in the main kitchen, reaching all Pods across 2 rooms. To reach any Pods still outside of range, you will need additional Hubs.

3) All Hubs need an Internet connection to transmit data to the Software. This can be via a WiFi router, WiFi extender or Ethernet cable. If WiFi is used, Hubs must be in range of router or extender.

4) This is an example of the ideal hardware setup. All Pods are within range of a Hub and all Hubs are within range of an Internet connection - so all data can be transmitted into the Software.
